

Reflectors for better visibility and safety

Reflectors are simple yet effective elements of passive guidance. They reflect incident light back towards the light source, making traffic routes, obstacles or boundaries more easily visible even in the dark, at dusk or in poor weather conditions. Glass bead reflectors, in particular, operate on the principle of retroreflection, ensuring reliable visibility from various angles of approach.

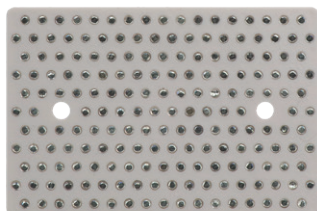

Reflectors are used wherever guidance and safety are required: on guide posts, crash barriers, road markings, building sites, access roads, car parks, industrial sites or along traffic routes. They aid visual guidance, mark hazardous areas and help to clearly structure routes.

Features

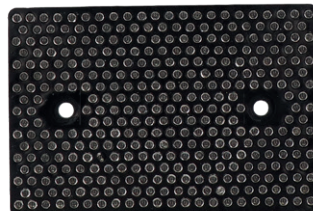

- Highly visible without the need for a separate electric power supply
- Made out of robust, durable plastic – suitable for long-term outdoor use
- Glass bead reflectors
- Complies with standard EN 12899-3
- Easy to install and low maintenance
- Available in a wide range of shapes, sizes and colour combinations
